# Introduction

In its broadest sense, a *macro* is a sequence of instructions that automates some aspect of Excel so that you can work more efficiently and with fewer errors. You might create a macro, for example, to format and print a month-end sales report. After you develop the macro, you can execute it to perform many time-consuming procedures automatically.

Macros are written in VBA, which stands for Visual Basic for Applications. VBA is a programming language developed by Microsoft and a tool used to develop programs that control Excel.

Excel programming terminology can be a bit confusing. For example, VBA is a programming language but also serves as a macro language. What do you call something written in VBA and executed in Excel? Is it a macro or is it a program? Excel's Help system often refers to VBA procedures as *macros*, so this is the terminology used in this book.

You'll also see the term *automate* throughout this book. This word means that a series of steps are completed automatically. For example, if you write a macro that adds color to some cells, prints the worksheet, and then removes the color, you have automated those three steps.

You're probably aware that people use Excel for thousands of different tasks. Here are just a few examples:

- » Keeping lists of things, such as customer names and transactions
- » Budgeting and forecasting
- » Analyzing scientific data
- » Creating invoices and other forms
- » Developing charts from data

The list could go on and on. The point is simply that Excel is used for a wide variety of tasks, and everyone reading this book has different needs and expectations regarding Excel. One thing most readers have in common, however, is the need to automate some aspect of Excel, which is what macros (and this book) are all about.

# About This Book

This book approaches the topic of Excel macros with the recognition that programming VBA takes time and practice — time that you may not have right now. In fact, many analysts don't have the luxury of taking a few weeks to become expert at VBA. So instead of the same general overview of VBA topics, this book provides some of the most commonly used real-world Excel macros.

Each section in the book outlines a common problem and provides an Excel macro to solve the problem — along with a detailed explanation of how the macro works and where to use it.

Each section presents the following:

- » The problem
- » The macro solution
- » How the macro works

After reading each section, you'll be able to

- » Immediately implement the required Excel macro
- » Understand how the macro works
- » Reuse the macro in other workbooks or with other macros

The macros in this book are designed to get you up and running with VBA in the quickest way possible. Each macro tackles a common task that benefits from automation. The idea here is to learn through application. This book is designed so that you can implement the macro while getting a clear understanding of what the macro does and how it works.

## Foolish Assumptions

I make three assumptions about you as the reader:

- » You've installed Microsoft Excel 2007 or a higher version.

- » You have some familiarity with the basic concepts of data analysis, such as working with tables, aggregating data, creating formulas, referencing cells, filtering, and sorting.
- » You have an Internet connection so you can download the sample files, found at [www.dummies.com/go/excelmacros](http://www.dummies.com/go/excelmacros).

## Icons Used in This Book

TIP

Tip icons cover tricks or techniques related to the current discussion.

REMEMBER

Remember icons indicate notes or asides that are important to keep in mind.

WARNING

Warning icons hold critical information about pitfalls you will want to avoid.

## Beyond the Book

In addition to the material in the print or e-book you're reading, this product comes with more online goodies:

- » **Sample files:** Each macro in this book has an associated sample file that enables you to see the macro working and to review the code. You can use the sample files also to copy and paste the code into your environment (as opposed to typing each macro from scratch). Download the sample files at:

[www.dummies.com/go/excelmacros](http://www.dummies.com/go/excelmacros)

Each macro in this book has detailed instructions on where to copy and paste the code. In general terms, you open the sample file associated with the macro, go to the Visual Basic Editor (by pressing Alt+F11), and copy the code. Then you go to your workbook, open the Visual Basic Editor, and paste the code in the appropriate location.

REMEMBER

TIP

Note that in some macros, you need to change the macro to suit your situation. For example, in the macro that prints all workbooks in a directory (see Chapter 4), you point to the C:\Temp\ directory. Before using this macro, you must edit it to point to your target directory.

If a macro is not working for you, most likely a component of the macro needs to be changed. Pay special attention to range addresses, directory names, and any other hard-coded names.

» **Cheat sheet:** The cheat sheet offers shortcut keys that can help you work more efficiently in Excel's Visual Basic Editor. You can find the cheat sheet by visiting [www.dummies.com](http://www.dummies.com) and searching for "Excel Macros Cheat Sheet".

## Where to Go from Here

If you're completely new to Excel macros, start with Part 1 (Chapters 1 – 3) to get the fundamentals you'll need to leverage the macros in this book. There, you will gain a concise understanding of how macros and VBA work, along with the basic foundation you need to implement the macros provided in this book.

If you've got some macro experience and want to dive right into the macro examples, feel free to peruse Chapters 4 – 9 and search for the task or macro that looks interesting to you. Don't worry. Each macro example stands on its own within its own section that gives you all the guidance you need to understand and implement the code in your own workbook.

Visit Part 2 if you're interested in macros that automate common workbook and worksheet tasks to save time and gain efficiencies.

Explore Part 3 to find macros that navigate ranges, format cells, and manipulate the data in your workbooks.

If you want to find macros that work with PivotTables, charts, and emails, thumb through the macros in Part 4 where you will discover macros that automate redundant PivotTable and chart tasks, as well as macros that send emails and connect to external data sources.

Don't forget to hit Part 5 for some useful tips and advice on how to get the most out of your new macro skills.

Here are some final things to keep in mind while working with the macros in this book:

- » **Any file that contains a macro must have the .xlsm file extension.** See the section on macro-enabled file extensions in Chapter 1 for more information.
- » **Excel does not run macros until they are enabled.** As you implement these macros, you and your customers must comply with Excel's macro security measures. See the section in Chapter 1 on macro security in Excel for details.
- » **You cannot undo macro actions.** When working in Excel, you can often undo the actions you've taken because Excel keeps a log (called the undo stack) recording your last 100 actions. However, running a macro automatically destroys the undo stack, so you can't undo the actions you take in a macro.
- » **You need to tweak the macros to fit your workbook.** Many of the macros reference example sheet names and ranges that you may not have in your workbook. Be sure to replace references like "Sheet 1" or Range("A1") with the sheet names and cell addresses you are working with in your own workbooks.

# Chapter 1

# Macro Fundamentals

A *macro* is essentially a set of instructions or code that you create to tell Excel to execute any number of actions. In Excel, macros can be written or recorded. The key word here is recorded.

Recording a macro is like programming a phone number into your cell phone. You first manually dial and save a number. Then when you want, you can redial those numbers with the touch of a button. Just as on a cell phone, you can record your actions in Excel while you perform them. While you record, Excel gets busy in the background, translating your keystrokes and mouse clicks to written code (also known as Visual Basic for Applications (VBA)). After a macro is recorded, you can play back those actions anytime you want.

In this chapter, you'll explore macros and learn how you can use macros to automate your recurring processes to simplify your life.

## Why Use a Macro?

The first step in using macros is admitting you have a problem. Actually, you may have several problems:

- » **Problem 1 - Repetitive tasks:** As each new month rolls around, you have to make the donuts (that is, crank out those reports). You have to import that data.

You have to update those PivotTables. You have to delete those columns, and so on. Wouldn't it be nice if you could fire up a macro and have those more redundant parts of your dashboard processes done automatically?

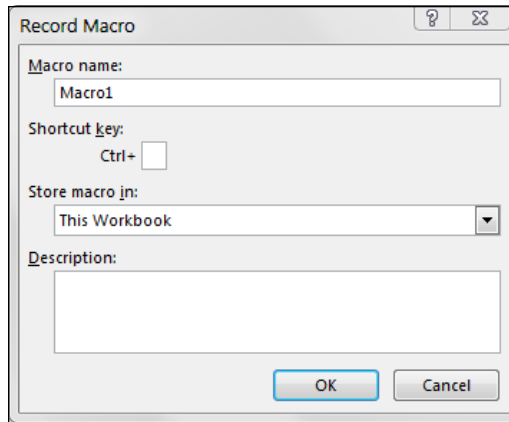

- » **Problem 2 - You're making mistakes:** When you go hand-to-hand combat with Excel, you're bound to make mistakes. When you're repeatedly applying formulas, sorting, and moving things around manually, there's always that risk of catastrophe. Add to that the looming deadlines and constant change requests, and your error rate goes up. Why not calmly record a macro, ensure that everything is running correctly, and then forget it? The macro is sure to perform every action the same way every time you run it, reducing the chance of errors.
- » **Problem 3 - Awkward navigation:** You often create reports for an audience that probably has a limited knowledge of Excel. It's always helpful to make your reports more user-friendly. Macros can be used to dynamically format and print worksheets, navigate to specific sheets in your workbook, or even save the open document in a specified location. Your audience will appreciate these little touches that help make perusal of your workbooks a bit more pleasant.

## Macro Recording Basics

To start recording your first macro, you need to first find the Macro Recorder, which is on the Developer tab. Unfortunately, Excel comes out of the box with the Developer tab hidden — you may not see it on your version of Excel at first. If you plan to work with VBA macros, you'll want to make sure that the Developer tab is visible. To display this tab

1. Choose File ⇨ Excel Options.
2. In the Excel Options dialog box, select Customize Ribbon.
3. In the list box on the right, place a check mark next to Developer.
4. Click OK to return to Excel.

Now that you have the Developer tab showing in the Excel Ribbon, you can start up the Macro Recorder by selecting Record Macro from the Developer tab. This activates the Record Macro dialog box, as shown in Figure 1-1.

**FIGURE 1-1:**  
The Record  
Macro dialog box.

Here are the four parts of the Record Macro dialog box:

- » **Macro Name:** This should be self-explanatory. Excel gives a default name to your macro, such as Macro1, but you should give your macro a name more descriptive of what it actually does. For example, you might name a macro that formats a generic table as FormatTable.
- » **Shortcut Key:** Every macro needs an event, or something to happen, for it to run. This event can be a button press, a workbook opening, or in this case, a keystroke combination. When you assign a shortcut key to your macro, entering that combination of keys triggers your macro to run. This is an optional field.
- » **Store Macro In:** This Workbook is the default option. Storing your macro in This Workbook simply means that the macro is stored along with the active Excel file. The next time you open that particular workbook, the macro is available to run. Similarly, if you send the workbook to another user, that user can run the macro as well (provided the macro security is properly set by your user — more on that later in this chapter).
- » **Description:** This is an optional field, but it can come in handy if you have numerous macros in a spreadsheet or if you need to give a user a more detailed description about what the macro does.

With the Record Macro dialog box open, follow these steps to create a simple macro that enters your name into a worksheet cell:

- 1. Enter a new single-word name for the macro to replace the default Macro1 name.**

A good name for this example is MyName.

**2. Assign this macro to the shortcut key Ctrl+Shift+N.**

You do this by entering uppercase N in the edit box labeled Shortcut Key.

**3. Click OK.**

This closes the Record Macro dialog box and begins recording your actions.

**4. Select any cell on your Excel spreadsheet, type your name into the selected cell, and then press Enter.**

**5. Choose Developer ⇨ Code ⇨ Stop Recording (or click the Stop Recording button in the status bar).**

## Examining the macro

The macro was recorded in a new module named Module1. To view the code in this module, you must activate the Visual Basic Editor. You can activate the VB Editor in either of two ways:

- » Press Alt+F11.
- » Choose Developer ⇨ Code ⇨ Visual Basic.

In the VB Editor, the Project window displays a list of all open workbooks and add-ins. This list is displayed as a tree diagram, which you can expand or collapse. The code that you recorded previously is stored in Module1 in the current workbook. When you double-click Module1, the code in the module appears in the Code window.

The macro should look something like this:

```
Sub MyName()  
,  
    ' MyName Macro  
,  
    ' Keyboard Shortcut: Ctrl+Shift+N  
,  
    ActiveCell.FormulaR1C1 = "Michael Alexander"  
  
End Sub
```

The macro recorded is a Sub procedure named MyName. The statements tell Excel what to do when the macro is executed.

Notice that Excel inserted some comments at the top of the procedure. These comments are some of the information that appeared in the Record Macro dialog

box. These comment lines (which begin with an apostrophe) aren't really necessary, and deleting them has no effect on how the macro runs. If you ignore the comments, you'll see that this procedure has only one VBA statement:

```
ActiveCell.FormulaR1C1 = "Michael Alexander"
```

This single statement causes the name you typed while recording to be inserted into the active cell.

## Testing the macro

Before you recorded this macro, you set an option that assigned the macro to the Ctrl+Shift+N shortcut key combination. To test the macro, return to Excel by using either of the following methods:

- » Press Alt+F11.
- » Click the View Microsoft Excel button on the VB Editor toolbar.

When Excel is active, activate a worksheet. (It can be in the workbook that contains the VBA module or in any other workbook.) Select a cell and press Ctrl+Shift+N. The macro immediately enters your name into the cell.

REMEMBER

In the preceding example, notice that you selected the cell to be altered before you started recording your macro. This step is important. If you select a cell while the macro recorder is turned on, the actual cell that you selected is recorded into the macro. In such a case, the macro would always format that particular cell, and it would not be a general-purpose macro.

## Editing the macro

After you record a macro, you can make changes to it (although you must know what you're doing). For example, assume that you want your name to be bold. You could re-record the macro, but this modification is simple, so editing the code is more efficient. Press Alt+F11 to activate the VB Editor window. Then activate Module1 and insert the following statement before the End Sub statement:

```
ActiveCell.Font.Bold = True
```

The edited macro appears as follows:

```
Sub MyName()  
,
```

```
' MyName Macro
'
' Keyboard Shortcut: Ctrl+Shift+N
'

    ActiveCell.Font.Bold = True

    ActiveCell.FormulaR1C1 = "Michael Alexander"

End Sub
```

Test this new macro, and you see that it performs as it should.

## Comparing Absolute and Relative Macro Recording

Now that you've read about the basics of the Macro Recorder interface, it's time to go deeper and begin recording macros. The first thing you need to understand before you begin is that Excel has two modes for recording — absolute reference and relative reference.

### Recording macros with absolute references

Excel's default recording mode is in absolute reference. As you may know, the term absolute reference is often used in the context of cell references found in formulas. When a cell reference in a formula is an absolute reference, it does not automatically adjust when the formula is pasted to a new location.

The best way to understand how this concept applies to macros is to try it out. Open the Chapter 1 Sample File.xlsx file and record a macro that counts the rows in the Branchlist worksheet. (See Figure 1-2.)

TIP

The sample dataset used in this chapter can be found on this book's companion website at [www.dummies.com/go/excelmacros](http://www.dummies.com/go/excelmacros).

Follow these steps to record the macro:

1. **Before recording, make sure cell A1 is selected.**
2. **Select Record Macro from the Developer tab.**
3. **Name the macro AddTotal.**
4. **Choose This Workbook for the save location.**
