# The Domain of UX in Information Studies: Bridging Theories, Research, and Professional Practice

---

# **Synthesis Lectures on Information Concepts, Retrieval, and Services**

## **Series Editor**

Gary Marchionini, School of Information and Library Science, The University of North Carolina at Chapel Hill, Chapel Hill, USA

This series publishes short books on topics pertaining to information science and applications of technology to information discovery, production, distribution, and management. Potential topics include: data models, indexing theory and algorithms, classification, information architecture, information economics, privacy and identity, scholarly communication, bibliometrics and webometrics, personal information management, human information behavior, digital libraries, archives and preservation, cultural informatics, information retrieval evaluation, data fusion, relevance feedback, recommendation systems, question answering, natural language processing for retrieval, text summarization, multimedia retrieval, multilingual retrieval, and exploratory search.

## Overview

This book was inspired by the experiences of both authors in their years of involvement in academic research and teaching, as well as conducting User Experience (UX henceforth) research and design in work practices. As a result of their experience in the field, both authors observe differences in the expectations, accepted norms, and outcomes of UX research between the academic side and the applied side. The degree of separation of applied and academic UX research is alarming and has not been adequately addressed by the UX community. In two international studies surveying UX researchers in academic and practical settings, Law et al. (2009) and Lallemand et al. (2015) found that a wide gap exists in definitions, understanding of the nature of UX work, and methodologies between the two domains. This disconnect includes a lack of synergy between research discoveries in the academic realm and research discoveries in applied settings. It also results in localized and segmented UX efforts, with findings shared only within a circle of UX researchers. Because both scholarly and practical UX efforts tend to stay within a particular setting, much work has been done separately with duplicated efforts and missed opportunities for cross-pollination of knowledge and advancements across the two domains.

In his review of 100 years of the UX field, Jakob Nielsen (2017) acknowledged that while the century-long perspective is “positive beyond belief” and “UX has come a long way since 1950,” he still feels “the overall quality of user experience... is less than 10% of what it should be.”

For UX research to truly advance, and for the UX communities to thrive, it is crucial to identify points of convergence between academic and applied UX research. As Lallemand et al. (2015) argue, “the numerous differences observed between Industry and Academia
